Project Design Phase-II
Technology Stack (Architecture & Stack)

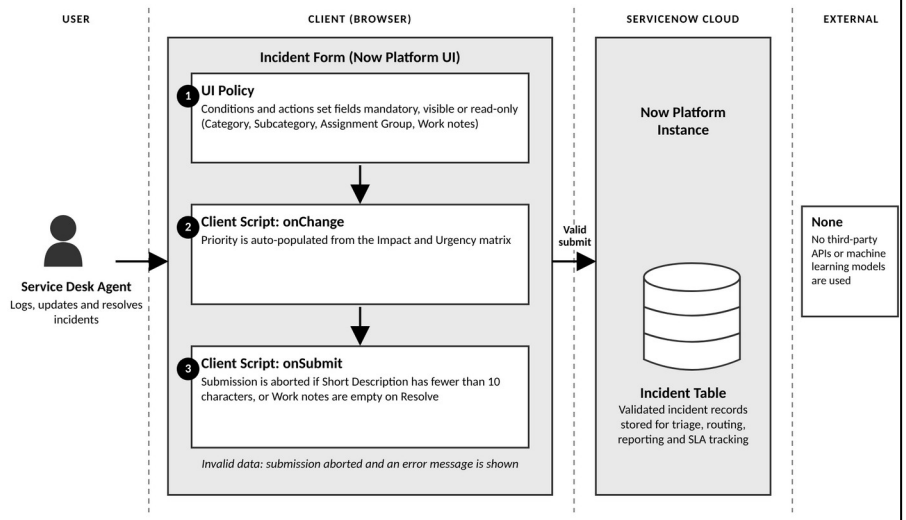

Date	4 October 2026
Team ID	
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Technical Architecture:

The Deliverable shall include the architectural diagram as below and the information as per the table1 & table 2

Example: Incident data validation using UI Policies and Client Scripts

Reference: https://docs.servicenow.com/

Guidelines:

- Include all the processes (As an application logic / Technology Block)
- Provide infrastructural demarcation (Local / Cloud)
- Indicate external interfaces (third party API's etc.)
- Indicate Data Storage components / services
- Indicate interface to machine learning models (if applicable)

Table-1 : Components & Technologies:

S.No	Component	Description	Technology
1.	User Interface	Incident form used by agents to log, update and resolve incidents	ServiceNow platform UI
2.	Application Logic-1	UI Policy Actions set fields mandatory, visible or read-only	ServiceNow UI Policy
3.	Application Logic-2	Client Script (onChange) auto-populates Priority from Impact and Urgency	JavaScript (Client Script, g_form API)
4.	Application Logic-3	Client Script (onSubmit) validates fields and aborts invalid submissions	JavaScript (Client Script, g_form API)
5.	Database	Incident table (incident) fields and choice lists	ServiceNow relational database
6.	Cloud Database	Database service hosting Incident records in the cloud	ServiceNow cloud-hosted instance
7.	File Storage	No file storage required; no files are processed	Not applicable
8.	External API-1	No external API used; only platform client-side APIs	Not applicable
9.	External API-2	No second external API used	Not applicable
10.	Machine Learning Model	No ML model; Priority comes from a rule-based matrix	Rule-based logic
11.	Infrastructure (Server / Cloud)	Deployment on the ServiceNow cloud instance Local Server Configuration: Not applicable Cloud Server Configuration: ServiceNow-hosted	ServiceNow Cloud (Now Platform)

Table-2: Application Characteristics:

S.No	Characteristics	Description	Technology
1.	Open-Source Frameworks	No open-source frameworks required; implemented with platform-native features	ServiceNow client-side JavaScript APIs
2.	Security Implementations	Role-based access control on the Incident table; client-side controls complement server-side enforcement	ServiceNow roles and ACLs
3.	Scalable Architecture	Rules are defined once at table level and apply to all Incident records and users	Table-level UI Policies and Client Scripts
4.	Availability	Runs with the ServiceNow instance; no additional servers are needed	ServiceNow cloud platform
5.	Performance	Validation runs in the browser, so field checks need no server round trip	Client-side JavaScript (g_form)
